

ABSTRACT

1  
2       Modular containers that can be interconnected, for multiple  
3 uses of the type that, forming a bottle or similar thing, of  
4 structure and materials usually developed for their disposal,  
5 essentially includes a bottom and lateral walls finished in a top  
6 wall. This top wall is prolonged in a neck delimiting an access  
7 mouth to an interior of the container that can be shut by means  
8 of a cover that is removable. The lateral walls, as do those of  
9 the bottom and top, possess means of lateral and top  
10 interconnection with other containers of similar characteristics,  
11 including compatible recesses and salients and of reciprocal fit  
12 through pressure.
